

48-core optical cable with no metal content

Article Overview

A 48-core optical fiber cable with no metal content is typically a fully dielectric, loose-tube cable using high-modulus plastics and fiber-reinforced plastic (FRP) as the central strength member.

Construction and Materials

Non-metallic 48-core fiber optic cables are designed to be completely free of metal, making them ideal for environments where electrical conductivity or corrosion is a concern. Key features include:

- Fibers: 250µm single-mode fibers (commonly G.652D) arranged in loose tubes .
- Loose Tubes: Made of high-modulus plastic, filled with a water-resistant gel to prevent moisture ingress .
- Central Strength Member: Fiber Reinforced Plastic (FRP) provides tensile strength without using metal .
- Stranding: Tubes and fillers are stranded around the FRP core to form a compact, circular cable core .
- Sheath: Outer protective layer typically made of PE, PVC, or LSZH for environmental protection . Optional features can include flame resistance, anti-rodent protection, and UV resistance, depending on deployment requirements .
