

Adjustable fiber optic cable delivery frame

Article Overview

Adjustable fiber optic cable delivery frames provide flexible, scalable solutions for managing and distributing fiber cables in FTTH and network environments.

Key Features and Applications

Adjustable fiber optic frames are designed to organize, protect, and route fiber optic cables efficiently. They are commonly used in FTTH networks, wall boxes, and access points, and can accommodate both small and large splice closures . Many frames feature a rotating main part mounted on a pole or wall, which simplifies cable winding and management . They are suitable for plug-and-play installations and can be combined with covers and brackets to form a complete management cabinet .

Mounting and Installation

- Pole-mounted frames: Often include composite material brackets for wooden poles, providing proper spacing and stability .
- Wall-mounted frames: Can be installed in wall boxes or as standalone frames, allowing vertical or top-mounted ducting .
- Flat-packed delivery: Some frames, like the FOSS FR70, are delivered in cartons for easy transport and assembly .
- Rotatable design: Frames may rotate on the mounting bracket, facilitating cable handling and maintenance
