

# Beam lamp wires connected in series in the distribution box

## Article Overview

Connecting beam lamp wires in series creates a single path for current, dividing the total voltage among all lamps, but a failure in one lamp interrupts the entire circuit.

### Understanding Series Wiring

In a series circuit, each lamp is connected end-to-end so that the electrical current flows sequentially through every lamp before returning to the power source. The current remains the same through all lamps, while the voltage is divided among them according to each lamp's resistance . This means that if you connect multiple beam lamps in series, each lamp receives only a portion of the total supply voltage, which must be considered to avoid under- or over-voltage conditions .

### Practical Steps for Series Connection in a Distribution Box

- Turn off the main power to ensure safety before making any connections .
- Prepare the wires: Strip the insulation from the ends of the wires using a wire stripper. Use appropriate gauge wire (commonly 14/2 for lighting circuits) to handle the current .
- Connect the first lamp: Attach the phase (live) wire from the distribution box to one terminal of the first lamp.
- Link subsequent lamps: Connect the neutral terminal of the first lamp to the phase terminal of the second lamp, and continue this pattern for all lamps in the series .
- Complete the circuit: Connect the neutral terminal of the last lamp back to the neutral bus in the distribution box. Optionally, a switch can be installed on the first l...
