

Cable tray 300mm diameter bend

Article Overview

For a 300mm wide cable tray, the minimum bend radius should meet or exceed the largest cable's minimum bend requirement, with standard tray bend radii typically 300mm, 450mm, 600mm, or 900mm.

Minimum Bend Radius

The minimum bend radius of a cable tray is determined by the largest cable diameter in the tray multiplied by a bending factor (K), which depends on cable type: for example, $K = 10$ for multicore power cables and $K = 12$ for single-core cables. The resulting radius must then be rounded up to the next standard tray bend radius, such as 300mm, 450mm, 600mm, or 900mm, to ensure safe installation and prevent cable damage during bending .

Methods for Bending

- Pre-fabricated Bends: Most manufacturers provide elbows, tees, and crosses for 300mm trays in standard radii (305mm, 610mm, 915mm, 1220mm) and angles (30°, 45°, 60°, 90°). Using these ensures compliance with standards and avoids field fabrication .
- Field Fabrication: If a pre-fabricated bend is not available, a 90-degree bend can be made by:
 - Marking the side rails at intervals based on the calculated arc length.
 - Cutting V-notches along the marked points.
 - Bending the tray gradually until the desired angle is achieved.
 - Ensuring the internal radius meets the minimum cable bend requirement to avoid cable stress
