

Can cable trays be installed in the ventilation room

Article Overview

Yes, cable trays can be installed in ventilation rooms, provided the cables and tray types comply with NEC and fire safety requirements.

Code Compliance and Cable Types

Cable trays in ventilation rooms, which are considered air-handling spaces, must follow NEC Section 300-22. Only certain cable types are allowed in these areas, including Type MI (Mineral Insulated) cables, Type MC (Metal Clad) cables without non-metallic coverings, and plenum-rated cables such as PLTC, fire protective signaling, and optical fiber cables . These cables are designed to resist fire and produce low smoke, ensuring safety in air-handling spaces.

Tray Types and Installation

The recommended cable tray types for ventilation rooms include ladder trays, ventilated troughs, ventilated channels, and solid-bottom trays. Ladder and ventilated trough trays are preferred for heat dissipation and cable support, while solid-bottom trays may be used for specific cable types . Proper installation must ensure that trays are mechanically supported, grounded, and bonded according to NEC Article 392 and OSHA standards .
