

Common Galvanized Pipe Cable Trays

Article Overview

Galvanized cable trays are metal pathways used to support, protect, and route electrical cables, with common types including pre-galvanized, hot-dip galvanized, and perforated trays.

Types of Galvanized Cable Trays

- **Pre-Galvanized (PG) Cable Trays** Pre-galvanized trays are made from steel sheets coated with zinc before fabrication. They are ideal for dry indoor environments such as office buildings or factories. The zinc coating is typically 12–20 microns thick, providing moderate corrosion resistance. These trays are cost-effective but are not suitable for outdoor or high-moisture areas, as rust may appear within 6–12 months if exposed to the elements .
- **Hot-Dip Galvanized (HDG) Cable Trays** HDG trays are fully fabricated trays dipped into molten zinc, creating a thick, uniform coating (65–85 microns) that covers all edges, corners, and perforations. This process ensures long-term corrosion resistance, making HDG trays suitable for outdoor installations, coastal areas, or chemical facilities. They are more durable and can last 20 years or longer without significant maintenance .
- **Perforated and Trunking Styles** Galvanized trays can also come in perforated or solid trunking styles, which allow for better ventilation, heat dissipation, and cable organization. Perforated trays are commonly used for data centers, industrial plants, and control systems, where airflow and cable separation are important .

Material and Surface Considerations

- **GI (Galvanized Iron) Trays:** Standard galvanized steel, often used in general indoo...
