

Concept of In-Home Optical Cable

Overview

Indoor Optical Cable is intended primarily for use within an environmentally controlled structure (e., home, commercial, or controlled environment vault) to transport optical signals within that structure. In an FTTH network, fiber cable is used over the “last mile” in place of lower bandwidth DSL and coaxial wires. Fiber to the home is one of many. Fiber to the home FTTH is a method in which a telecom provider directly conjoins a fiber optic line to their network from your house. The copper wire is to transmit the data where fiber is used only at the last. The FTTH Council Europe aims at advancing ubiquitous full fibre-based connectivity to the whole of Europe, with the vision that fibre connectivity will transform the way people live, do business and interact, connecting everyone, everything, everywhere. Thus the cables are generally designed to provide high tensile strength, crush resistance and to withstand temperature changes between -40°C and $+70^{\circ}\text{C}$ with attenuation changes as low as possible.
