

Conflict between distribution box and cabinet

Article Overview

Distribution boxes and cabinets differ in size, capacity, and function, and conflicts usually arise when their roles or installation requirements overlap or are misunderstood.

Key Differences

Distribution Box:

- Smaller, often wall-mounted or embedded.
- Handles low-current circuits for lighting, sockets, or small equipment.
- Contains miniature circuit breakers (MCBs) for protection.
- Acts as a "splitter" distributing power to individual rooms or areas .

Cabinet:

- Larger, usually floor-mounted, with standard heights of 1800–2200mm.
- Handles higher currents and main power distribution to multiple distribution boxes or large loads.
- Equipped with molded case circuit breakers (MCCBs) or air circuit breakers (ACBs).
- Typically located in substations, server rooms, or large commercial buildings .

Common Sources of Conflict

- Capacity Mismatch: Installing a distribution box where a cabinet is required can lead to overloads, insufficient protection, or frequent tripping. Conversely, using a cabinet for small circuits may be unnecessarily costly and space-consuming
