

Correct Configuration Diagram for Home Electrical Distribution Boxes

Article Overview

A home distribution box should be configured with a main double-pole MCB, followed by an RCCB for protection, and individual single-pole MCBs for each circuit, with proper neutral and earth connections.

Key Components and Layout

- Main Switch (Double-Pole MCB)
 - Acts as the isolator for the entire home supply.
 - Connects the incoming phase and neutral wires from the utility to the distribution box.
 - Typically rated at 63A for domestic installations .
- Residual Current Device (RCCB/RCD)
 - Provides protection against electric shock and leakage currents.
 - Connected immediately after the main switch; the output feeds the individual circuit breakers.
 - Commonly rated at 30mA for domestic use .
- Circuit Breakers (Single-Pole or Double-Pole MCBs)
 - Single-pole MCBs are used for lighting, sockets, and small appliances.
 - Double-pole MCBs may be used for high-power appliances like water heaters or air conditioners.
 - Each MCB output connects to its respective load circuit
