

DIY Simple Fiber Separation Box

Article Overview

You can create a simple fiber separation box using a small enclosure, splice trays, and fiber guides to safely organize and protect fiber optic cables.

Materials Needed

- Enclosure: A small plastic or metal box with a removable lid works well for DIY setups. Ensure it is large enough to accommodate your fiber length and splice trays.
- Splice trays or holders: These keep fibers organized and prevent bending beyond safe limits. You can use small plastic trays or even repurpose shallow containers.
- Fiber guides or clips: Small hooks, cable ties, or adhesive clips help route fibers neatly inside the box.
- Protective sleeves: Heat-shrink or plastic sleeves protect spliced fiber ends.
- Labeling materials: Tape or markers to identify each fiber strand.
- Basic tools: Fiber strippers, scissors, isopropyl alcohol, and lint-free wipes for cleaning fiber ends .

Assembly Steps

- Prepare the enclosure: Drill or cut entry and exit holes for the fiber cables. Ensure smooth edges to avoid damaging fibers.
- Install splice trays: Secure the trays inside the box. These will hold the fibers in gentle loops to prevent sharp bends.
- Route fibers: Use fiber guides or clips to route each fiber from the entry point to the splice tray. Maintain a minimum bend radius to avoid signal loss.
- Splice or terminate fibers: If needed, splice fibers using mechanical splices or quick connectors. Clean all fiber ends with alcohol and lint-free wipes before insertion
