

Difficulty in splicing optical cables

Overview

The article discusses the methods, tools, and challenges involved in fiber-optic cable splicing, including fusion splicing, cleaving, and temporary lab splices. What is a mechanical splice?

What is a fusion splice?

Why splice?

Fiber splicing is one way to join two optical fibers together so the light energy from one optical fiber can be transferred to another. So in essence, fiber optic splicing is a process used to join two separate fiber optic cables together. Through splicing, fiber optic technicians can extend the length of the fiber to make it long enough for use in a required cable run. At Turn-Key. Executive Summary: Fiber optic cable failures cost enterprises an average of \$15,000 per hour in network downtime—yet most catastrophic losses stem from a handful of preventable installation errors. Done right, it produces connections with less than 0. For outside plant work, fusion splicing is almost always the right choice.
