

Distribution box distribution cabinet code

Article Overview

Distribution boxes and cabinets are classified and coded according to international standards (IEC 61439, IEC 60364), British Standards (BS 7671), and Uniclass codes for proper selection, installation, and compliance.

International and Regional Standards

IEC Standards: Distribution boxes and boards follow IEC 61439 for low-voltage switchgear and controlgear assemblies, and IEC 60364 for low-voltage electrical installations. These standards define requirements for safety, accessibility, protection, and environmental conditions, including IP ratings, clearance, and mounting dimensions . **BS 7671 (UK):** The British Standard aligns with IEC standards and specifies installation requirements for consumer units and distribution boards, including recommended mounting heights (1-1.8 meters for residential, 1.3 meters for elderly or handicapped users), accessibility, double insulation, and protection against environmental hazards . **National Codes:** In North America, similar installations are governed by the NEC (National Electrical Code), where residential boards are often called load centers, while in IEC industrial contexts, the term distribution board or distribution box is more common .

Uniclass Coding

Uniclass 2015/2026: Distribution boxes and switchboards are classified under the code Pr_60_70_22 in the latest Uniclass system, which provides a standardized framework for construction products and systems, facilitating specification, procurement, and documentation
