

Do the optical modules need to be a pair or are they the same

Overview

Different optical signals are transmitted and received within a single fiber; therefore, BIDI optical modules must be used in pairs. Visually, a BIDI module has only one port and uses only one optical fiber for connection. You can add or remove SFP modules in your switch without powering off the system. The bidirectional SFP modules combine two SFP optical devices that must be used as a pair to establish the. The optical module serves as a crucial component in optical fiber communication systems, operating at the physical layer, which is the lowest layer in the OSI model. Its primary function is to achieve optoelectronic conversion by converting electrical signals into optical signals and vice versa.
