

Does the new router have a fiber optic interface

Article Overview

Most standard routers do not have a built-in fiber optic interface; they typically require an SFP port or an Optical Network Terminal (ONT) to connect to fiber.

Understanding Fiber Connectivity

Routers that support fiber connections usually have a Small Form-Factor Pluggable (SFP) port, which allows you to insert a fiber module for direct fiber connectivity. For example, Cisco ISR 1100 series routers have one SFP port alongside standard Ethernet ports, while higher-end models like the Cisco Catalyst 8200 Series offer multiple SFP interfaces for fiber connections . If your router lacks an SFP port, it cannot directly accept a fiber optic cable.

Using an ONT with Standard Routers

In most residential setups, fiber optic internet is delivered via an Optical Network Terminal (ONT). The ONT converts the light signals from the fiber into electrical signals that a standard router can use. You then connect the ONT to your router using an Ethernet cable, typically into the WAN port . This setup allows routers without native fiber ports to still access fiber internet.

Key Considerations

- Router Compatibility: Ensure your router supports gigabit or multi-gigabit speeds...
