

Epon User Device Settings

Article Overview

EPON ONU devices can be configured via their web interface using the default IP address and login credentials, allowing setup of network, WAN, VLAN, and authentication settings.

Accessing the EPON ONU

- Connect to the ONU: Use an Ethernet cable to connect your PC directly to the ONU.
- Find the IP address: Most EPON ONUs use default IPs like 192.168.1.1, 192.168.0.1, or 192.168.100.1. On Windows, open Command Prompt, type ipconfig, and check the Default Gateway—this is your ONU's IP .
- Login: Open a web browser and enter the ONU IP. Use the default username and password printed on the device label (commonly admin/admin or similar), .

Basic Configuration

Once logged in, you can configure the following:

- WAN/Internet Connection: Choose between:
 - DHCP: Automatically assigns IP from ISP (most common).
 - Static IP: Manually enter IP, subnet mask, and gateway if provided by ISP.
 - PPPoE: Enter ISP-provided username and password for authentication .
- LAN Settings: Configure local network IP range, DHCP server, and LAN port modes. Some ONUs allow setting LAN ports as gateway or relay .
- VLAN and QoS: Set VLAN IDs for traffic separation and configure Quality of Service for prioritizing certain data streams
