

Fiber optic cable cannot reach the wireless router

Article Overview

Fiber optic cables cannot plug directly into standard wireless routers because the optical signal must first be converted into an electrical signal by an Optical Network Terminal (ONT) or compatible modem.

Understanding the Connection

Fiber optic internet transmits data as light pulses through glass or plastic fibers, which standard routers cannot interpret directly. The ONT serves as the intermediary device that converts these light signals into electrical signals compatible with your router. Without this conversion, the router cannot recognize or distribute the internet connection.

Proper Setup Steps

- Install the ONT: Connect the fiber optic cable from the wall outlet to the ONT's optical port. Power on the ONT and wait for the status lights to stabilize .
- Connect ONT to Router: Use a high-quality Ethernet cable (Cat5e or Cat6) to link the ONT's Ethernet/LAN port to the router's WAN port .
- Configure the Router: Access the router's admin panel via a web browser, enter any ISP credentials if required, and ensure firmware is up to date .
- Verify Connection: Check the router's indicator lights to confirm a successful connection. The ONT handles the optical-to-electrical conversion, allowing the router to distribute the internet wirelessly
