

Home Fiber-to-the-Home Access Switch

Article Overview

A Home FTTH Access Switch connects the optical network to individual residences, managing data traffic between the Optical Line Terminal (OLT) and the Optical Network Unit (ONU) at the subscriber's home.

Role and Functionality

A Home FTTH Access Switch serves as the interface between the service provider's fiber network and the end-user premises. It typically connects to the OLT at the central office or distribution node and distributes bandwidth to multiple ONUs or ONTs at homes, supporting high-speed internet, voice, and video services . These switches can operate in passive optical networks (PON) or active star (point-to-point) configurations, depending on network design .

Network Architecture

- **Passive Optical Network (PON):** The most common FTTH architecture, where a single fiber from the OLT is split to serve multiple homes. The access switch manages traffic without requiring power at the split points, reducing operational costs .
- **Active Star / Point-to-Point (P2P):** Each home has a dedicated fiber link to the switch, which requires powered equipment and possibly UPS and cooling. This provides higher bandwidth per subscriber but increases complexity and cost .

Deployment Considerations

- **Bandwidth:** Home access switches support gigabit or 10-gigabit connections, ofte...
