

Home electrical distribution box styles

Article Overview

Home electrical distribution boxes come in several types, including main panels, sub-panels, fuse boxes, and single-phase or three-phase distribution boxes, each serving specific roles in safely distributing electricity.

Main Types of Distribution Boxes

1. **Main Circuit Breaker Panel** This is the primary distribution box in a home, where electricity from the utility enters. It houses the main breaker, which can shut off power to the entire house, and individual circuit breakers for different circuits like lighting, outlets, and appliances. Modern homes typically use this instead of older fuse boxes for improved safety and overload protection ().

2. **Sub-Panels** Sub-panels are auxiliary panels connected to the main panel. They distribute power to specific areas, such as a basement, garage, or an extension. Sub-panels allow localized control without overloading the main panel and are useful in larger homes ().

3. **Fuse Boxes** Older homes may still have fuse boxes, which use fuses instead of breakers. Each fuse blows when current exceeds a limit, cutting off power to prevent damage. They are largely replaced by breaker panels in modern installations ().

4. **Single-Phase Distribution Boxes** These are common in residential homes. They typically use two wires (live and neutral) and handle voltages around 230V. They are suitable for low-power applications like lighting, small appliances, and standard household circuits ().

5. **Three-Phase Distribution Boxes** Used when higher power is needed, such as for large appliances or workshops. They use three live wires and one neutral, providing more stable and higher-capacity power distribution ().
