

Hot-selling network security equipment for power systems

Article Overview

Industrial firewalls, DPI-enabled switches, secure routers, and OT-focused cybersecurity solutions are currently the top-selling network security equipment for power systems.

Key Categories of Hot-Selling Equipment

1. Industrial Firewalls and Secure Routers Industrial firewalls are essential for segmenting operational technology (OT) networks from IT networks, creating secure demilitarized zones (DMZs), and blocking unauthorized access. Secure routers with embedded security capabilities provide encrypted communication, Zero Trust remote access, and identity-based microsegmentation, which are critical for protecting power system networks from cyber threats . 2. DPI-Enabled Industrial Switches Modern industrial switches with Deep Packet Inspection (DPI) can decode industrial protocols locally, monitor traffic, and detect anomalies in real time. These switches reduce the need for additional security appliances while providing visibility into every connected device, making them highly popular in power system deployments . 3. OT Security Platforms Comprehensive OT security solutions, such as Cisco Industrial Threat Defense, integrate asset discovery, vulnerability assessment, microsegmentation, and unified IT/OT threat detection. These platforms allow operators to monitor and respond to threats across the entire power system network from a single console . 4. PoE Devices for Security and Connectivity Power over Ethernet (PoE) switches and extenders are increasingly used in substations and remote power facilities to power IP-based devices like security cameras, sensors, and access points. High-performan...
