

How to connect fiber optic splitters splitters

Article Overview

To connect multiple fiber optic splitters, cascade them by linking the output of a primary splitter to the input of a secondary splitter while carefully managing signal loss and using compatible connectors.

Step 1: Understand Splitter Basics

A fiber optic splitter is a passive device that divides a single optical signal into multiple outputs without requiring power, making it ideal for FTTH or point-to-multipoint networks (). Each splitter introduces insertion loss, typically around 3.5 dB for a 1x2 splitter, which must be considered when cascading multiple splitters ().

Step 2: Choose Compatible Splitters

- Split ratio: Ensure the split ratios match your network needs (e.g., 1:2, 1:4, 1:8).
- Connector type: Use compatible connectors such as SC, LC, or APC.
- Fiber type: Match single-mode or multimode fibers depending on your network ().
- Environment: Select indoor (IP20) or outdoor (IP65/IP66) enclosures as required.

Step 3: Plan the Cascade

- Primary splitter: Connect the main fiber line from the ONT or OLT to the input port.
- Secondary splitter: Use a fiber patch cable to connect one output of the primary splitter to the input of the secondary splitter ()....
