

How to install the sheathing ring of the distribution box

Article Overview

Installing the sheathing ring involves securing the cable entry point to protect wires and maintain the integrity of the distribution box.

Step-by-Step Installation

1. Prepare the Distribution Box and Cables Ensure the distribution box is properly mounted and fixed in its designated location, typically at a height of around 1.5 meters for residential setups or according to industrial requirements . Verify that the enclosure has the correct IP or NEMA rating for protection against dust and moisture . Select cables of appropriate gauge for the load and strip the insulation carefully, leaving enough length to reach the terminals inside the box .
2. Select the Correct Sheathing Ring Choose a sheathing ring (cable gland) that matches the diameter of the incoming cable. The ring should provide a snug fit to prevent dust, water, or mechanical stress from affecting the wires . For outdoor or high-humidity environments, use a ring with higher protection ratings, such as IP66 or NEMA 4 .
3. Insert the Cable Through the Ring Slide the cable through the sheathing ring before connecting it to the terminals. Ensure the cable is straight and free from kinks. The ring should be positioned at the entry point of the distribution box, typically on the top or side, depending on the box design .
4. Secure the Sheathing Ring Tighten the ring to the enclosure using the provided nut or locking mechanism. The cable should be held firmly without excessive compression that could damage the insulation. This step ensures the cable is mechanically supported and prevents accidental pull-out .
5. Connect the Wires Inside the Box After securing the sheathing ring, connect the...
