

How to refresh the light module

Article Overview

Refreshing a light module involves either resetting a vehicle's LED control module or updating a software component to restore proper functionality.

Refreshing a Vehicle LED/Light Module

Vehicle light modules, also called LED control modules or body control modules, manage headlights, taillights, and interior lights. To refresh or reset them:

- Consult the Vehicle Manual: Check your car's service guide for module-specific instructions .
- Ensure Battery Charge: A fully charged battery is essential for a successful reset .
- Disconnect Aftermarket Accessories: Temporarily remove any additional lighting devices to prevent interference .
- Locate the Module: Common locations include under the dashboard, near the fuse box, or in the engine compartment .
- Manual Reset Procedure:
 - Disconnect the negative battery cable to cut power to the module.
 - Wait 15-20 minutes to allow the module to discharge and reset .
- Calibration (if applicable): For adaptive headlights, use a diagnostic scan tool (e.g., VCDS for VW/Audi, ISTA for BMW) to access the “Adaptive Lighting Module” and perform “Basic Settings” or “Calibration” to ensure proper beam alignment . Failing to reset or calibrate can cause flickering, unresponsive lights, or dashboard errors .
