

How to use an industrial switch to configure network cables

Article Overview

To configure network cables using an industrial switch, connect devices physically, assign IP addresses, set up VLANs, and enable security and routing features for reliable industrial Ethernet communication.

Physical Setup

- **Plan the Network Layout:** Identify all devices such as PLCs, sensors, actuators, and computers. Choose a suitable topology (star, ring, or line) based on redundancy and scalability needs .
- **Connect the Switch:** Power on the industrial switch and connect it to the network devices using appropriate Ethernet cables (Cat5e, Cat6, or industrial-grade cables). Use straight-through cables for connecting devices and crossover cables if connecting switches directly .
- **Management Access:** Connect a computer to the switch's management port or console port using a network or console cable. Ensure the computer has compatible management software or terminal software installed .

Initial Configuration

- **Access the Switch Interface:** Use the default IP address, username, and password to log in via a web browser or terminal software. If the credentials have been changed, use the updated login information .
- **Set Basic Parameters:** Configure system name, time, and check system information such as model and firmware version .
- **Assign IP Addresses:** Give each device a unique IP address and configure subnet...
