

How to wire the internal electrical distribution box

Article Overview

Wiring an indoor electrical distribution box involves safely connecting the main power supply to circuit breakers and outgoing circuits while ensuring proper grounding, insulation, and compliance with electrical standards.

Key Components of a Distribution Box

- Main MCB (Double Pole): Controls the incoming power supply and protects the system from overloads.
- Single-Pole MCBs: Protect individual circuits connected to lights, outlets, or appliances.
- RCCB (Residual Current Circuit Breaker): Provides protection against leakage currents and electric shocks.
- Busbars: For neutral and earth connections.
- Wiring: Appropriately rated wires for phase, neutral, and earth connections.

Step-by-Step Wiring Procedure

- Safety First: Ensure the main power supply is turned off before starting any work to prevent electric shock .
- Mount the Box: Secure the distribution box on a dry, accessible wall at a convenient height (typically ~1.5m) and away from water or flammable materials .
- Connect the Incoming Supply: Attach the incoming live (phase) wire to the main MCB and the neutral wire to the neutral busbar. Ensure the earth wire is connected to the grounding busbar
