

# How to wire the lighting circuit in the main electrical distribution box

## Article Overview

To wire a lighting circuit in a distribution box, connect the main supply to the main MCB, route the output through an RCCB, and then connect each lighting sub-circuit to individual MCBs with proper phase, neutral, and earth connections.

### Step 1: Prepare the Distribution Box

Start by identifying the main incoming supply (phase and neutral) and ensure the distribution box (DB) has the appropriate MCBs and RCCB for your load. For domestic lighting circuits, a single-phase 230V supply is typical, with a double-pole MCB as the main switch and single-pole MCBs for each lighting sub-circuit. Ensure the DB is properly earthed.

### Step 2: Connect the Main Supply

- Connect the phase and neutral wires from the incoming supply to the input terminals of the main MCB.
- Connect the output of the main MCB to the input of the RCCB. The RCCB protects against leakage currents and electric shocks.
- Connect the earth wire from the supply to the earth link in the DB.

### Step 3: Connect Lighting Sub-Circuits

- Each lighting sub-circuit should have its phase wire connected to the output of a s...
