

I can't access the internet after switching to a fiber optic router

Article Overview

If you can't access the internet with a fiber optic router, the issue may be due to hardware, cabling, or configuration problems, and systematic troubleshooting can help identify the cause.

Check Your Hardware and Connections

Start by inspecting all devices in your fiber setup: the Optical Network Terminal (ONT), your router, and any modems or wall power units. Ensure that the ONT is powered on and connected to a working electrical outlet, preferably a GFCI outlet if installed in a garage or outside your home. Verify that the Ethernet cable from the ONT to your router is securely plugged into the correct LAN/WAN port, and check for any visible damage to cables or connectors, including frays, bends, or contamination on fiber connectors .

Check Indicator Lights

Most fiber devices have LEDs indicating status. On the ONT, the Power LED should be on, the PON light should be active, and the Alarm LED should not be red. On your router, ensure the Data LED is on to confirm a connection to your home network. A blinking red light or an off LED may indicate a failure to obtain an IP address or a hardware issue .

Restart Devices...
