

Installation process of embedded distribution box

Article Overview

Embedded installation of a distribution box involves precise wall embedding, support, alignment, and anti-corrosion measures to ensure safety and durability.

Installation Height and Position

For embedded distribution boxes, the bottom edge of the box should be 1.5 meters from the ground, and the installation board should be at least 1.8 meters high. The box must be placed flat and vertical, with a deviation of no more than 3 mm, and the edges of the panel should align with the wall surface without being recessed or protruding .

Structural Support

- For boxes wider than 500 mm, a concrete lintel should be installed on top.
- For boxes 300 mm or wider, a reinforced brick lintel is recommended to prevent pressure on the box.
- When embedding in walls 240 mm thick, the back of the box should be recessed at least 20 mm, reinforced with a 10 mm asbestos board or a steel wire mesh (10 mm x 10 mm, 2 mm diameter), and plastered with 1:2 cement mortar to prevent cracking .
