

Internet connection drops when connected to fiber optic router

Article Overview

Internet drops after switching to a fiber optic router are often caused by physical connection issues, router configuration errors, or device compatibility problems.

Check Physical Connections

Start by inspecting all fiber cables and connectors. Look for visible damage, sharp bends, or loose plugs, as even minor imperfections can cause signal loss or intermittent connectivity . Clean connectors with lint-free wipes and isopropyl alcohol to remove dust or oil, which are common causes of fiber network failures . Ensure the Optical Network Terminal (ONT) and router are properly powered and securely connected.

Verify Router Configuration

Incorrect router settings can prevent stable internet access. Confirm that the WAN port is connected to the ONT and that LAN ports are correctly assigned to your devices . Check for IP conflicts, firmware updates, and proper routing settings, as outdated firmware or misconfigurations can lead to drops . If your router supports dual-band Wi-Fi, ensure devices are connected to the appropriate band (5 GHz for speed, 2.4 GHz for range) to avoid performance issues .
