

Micro-module computer room costs

Article Overview

A micro-module computer room typically costs between \$50,000 and \$200,000, depending on size, power capacity, and customization.

Overview

A micro-module computer room, or micro modular data center, is a compact, self-contained IT facility that integrates servers, power backup, cooling, security, and monitoring into a single pre-fabricated unit . These units are ideal for small offices, retail branches, healthcare clinics, telecom base stations, or any location with limited space or a need for rapid deployment .

Factors Affecting Cost

- **Size and Number of Cabinets:** Most micro-modules range from 1 to 10 cabinets, with each cabinet providing a certain number of “U” spaces for servers. More cabinets increase both capacity and cost .
- **Power Capacity:** Units typically offer 3 kVA to 20 kVA. Higher power requirements for critical systems, such as healthcare or financial applications, increase the price .
- **Cooling and Environmental Controls:** Integrated cooling systems, humidity control, and leak detection add to the cost but improve efficiency and reliability .
- **Deployment and Customization:** Pre-integrated, factory-tested units reduce on-site labor and construction costs, but custom configurations or ruggedized designs for industrial environments can raise the price .
- **Optional Features:** Remote monitoring, advanced security, and energy-efficient UPS systems may also affect the total cost
