

Mosa Industrial Switch Parameters

Article Overview

Moxa industrial switches, such as the EDS-518A series, can be configured via serial console, Telnet, or web browser, with key parameters including COM port, baud rate, data bits, parity, stop bits, and terminal type, while Modbus TCP can be enabled for SCADA integration.

Accessing the Switch

Moxa switches can be accessed in three main ways:

- **Serial Console:** Connect a short serial cable from the switch to a PC's COM port. This is useful if the switch's IP address is unknown. Configure the console with 115200 baud rate, 8 data bits, no parity, 1 stop bit, and VT100 terminal type ().
- **Telnet Console:** Allows remote command-line access over the network. Note that serial console and Telnet cannot be used simultaneously ().
- **Web Browser:** Provides a graphical interface for configuration. It can be used simultaneously with either serial console or Telnet ().

Serial Console Configuration

- Open the Communication Parameter page in the Moxa utility.
- Select the appropriate COM port.
- Set Baud Rate to 115200, Data Bits to 8, Parity to None, and Stop Bits to 1.
- Under the Terminal tab, select VT100 for terminal type and click OK ().
