

Positive pressure protection for distribution boxes

Article Overview

Positive pressure protection (Ex p) ensures safe operation of distribution boxes in hazardous environments by maintaining a slight overpressure inside the enclosure to prevent flammable gases or dust from entering.

Principle of Positive Pressure Protection

Positive pressure protection works by continuously supplying clean air or inert gas into the distribution box, creating a barrier that prevents external combustible gases or dust from entering the enclosure. Before energizing the equipment, the enclosure is purged multiple times to remove any flammable substances. During operation, a minimum pressure differential is maintained to resist leakage, ensuring that non-explosion-proof electrical components can operate safely inside the enclosure .

Key Components

A typical positive pressure system for distribution boxes includes:

- Air or Gas Supply Unit: Provides clean, dry compressed air or inert gas (e.g., nitrogen), .
- Pressurization Controller and Valve Group: Integrates differential pressure sensors, flow meters, purge valves, and logic control to maintain stable pressure .
- Alarm and Interlock Systems: Trigger alarms or shut down power if pressure or airflow drops below safe limits
