

Power grid optical cable fixing clamp rack type

Article Overview

Clamp racks for power grid optical cables include tension clamps, suspension clamps, and surplus cable racks, designed to secure, store, and manage optical fibers on towers or poles.

Types of Clamp Racks and Clamps

1. Tension Clamps: Used to anchor optical cables at terminal or corner towers, tension clamps hold the cable under mechanical stress, ensuring stability against wind, ice, and vibration. They are typically composed of pre-twisted wire, pull rings, and U-shaped rings, and can be made from aluminum-clad steel or galvanized steel depending on load requirements (). 2. Suspension Clamps: These clamps support the cable along spans between towers, reducing stress on the cable and preventing sagging. Suspension clamps are installed at intermediate points and are compatible with both ADSS and OPGW cables (). 3. Surplus Cable Racks (Remaining Cable Racks): These racks store excess optical cable at splice points or along towers. They come in two main types: inner button and outer disc. For iron towers, small splints are used to fix the rack; for poles, pole supports secure the rack. Each splice box is generally equipped with one surplus cable rack to manage leftover cable efficiently ().
