

Power indicator light on distribution box

Article Overview

A power indicator light on a distribution box visually signals whether the system is energized, in standby, or experiencing a fault, helping operators quickly assess electrical status.

Purpose and Function

Power indicator lights are installed in electrical panels, switchgear, and distribution boxes to provide instant visual feedback on system status without the need for measurement tools. They indicate whether power is present, if a circuit is operating normally, or if a fault has occurred . These lights are often integrated with circuit breakers, relays, and protection devices, activating during overloads, short circuits, or ground faults to alert operators .

Color Coding

Indicator lights typically use color-coded illumination to convey different conditions:

- Green: Power ON or normal operation
 - Red: Power OFF, fault, or trip condition
 - Yellow/Amber: Standby or transitional state
- In three-phase systems, separate lights may indicate the presence of each phase (L1, L2, L3), helping identify phase loss or imbalance, which can prevent equipment damage .

Types and Installation...
