

Pump-type distribution box

Article Overview

A pump-type distribution box is a hydraulic system component that allows multiple pumps to be driven simultaneously from a single power source, optimizing efficiency and control in industrial or mobile applications.

Function and Purpose

A pump-type distribution box, also known as a pump distribution gearbox or hydraulic pump box, is designed to distribute mechanical power from one input source to multiple hydraulic pumps. This enables the simultaneous operation of several pumps, which can drive different hydraulic functions such as lifting, swinging, or moving machinery components. It ensures precise and adaptable power distribution, improving efficiency and reducing the need for multiple independent power sources.

Design and Components

These boxes often feature modular designs with integrated hydraulic clutches, allowing customization for specific applications. Key components typically include:

- Input shaft: Receives power from a diesel engine, electric motor, or PTO (Power Take-Off).
- Gear mechanisms: Spur or planetary gears distribute power to multiple outputs.
- Hydraulic clutches: Enable selective engagement of pumps.
- Output shafts: Connect directly to hydraulic pumps for various functions. The modularity allows the system to be scaled for both small and large hydraulic setups, from mobile machinery to industrial installations....
