

Raw materials for cable trays in Mauritius

Article Overview

Cable trays in Mauritius are commonly made from galvanized steel, stainless steel, aluminum, and fiberglass, chosen for strength, corrosion resistance, and suitability to the humid coastal climate.

Common Raw Materials

Galvanized Steel: Hot-dip galvanized steel is widely used in Mauritius due to its excellent corrosion resistance, especially in coastal and humid environments. It provides high load-bearing capacity and durability, making it suitable for industrial, commercial, and infrastructure projects . **Stainless Steel:** Grades 304 and 316 stainless steel are preferred for environments requiring superior corrosion resistance. Stainless steel trays are ideal for coastal areas, chemical plants, and high-moisture locations . **Aluminum:** Aluminum alloys, such as 6063-T5, are lightweight and offer good conductivity, making them suitable for data centers and installations where weight reduction is important. Aluminum trays are approximately 42% lighter than steel but can be more expensive . **Fiberglass and Composite Materials:** Vinyl resin fiberglass trays are used in highly corrosive or high-temperature environments, such as chemical plants or areas with acidic conditions. They offer long-term durability and reduced maintenance costs .

Material Considerations

- **Corrosion Resistance:** Mauritius' humid, coastal climate necessitates materials that resist rust and salt spray. Hot-dip galvanization or stainless steel coatings are commonly applied
