

Replacement of the cover and outer shell of the distribution box

Article Overview

Replacing the cover and outer shell of a distribution box involves careful disconnection, selection of compatible materials, secure mounting, and adherence to safety standards.

Materials and Components

Distribution boxes typically consist of an outer shell and a cover. The shell is often made of steel or ABS plastic, providing structural strength and protection against mechanical damage, while the cover may be transparent PC (polycarbonate) to allow visual inspection of internal components without opening the box . Sealing rings made of silicon rubber ensure water and dust resistance, and internal guide rails (usually tin-plated) support mounting of circuit breakers and other devices .

Safety Precautions

Before starting the replacement:

- Turn off the main power supply to prevent electric shock .
- Verify that all circuits are de-energized using a multimeter.
- Wear insulated gloves and safety goggles.
- Ensure the work area is dry and well-ventilated .
