

Router with exclamation mark Fiber optic internet is working

Article Overview

An exclamation mark on your router or device usually indicates a problem with internet access, not the local connection to your router.

What the Exclamation Mark Means

Even if your fiber optic internet is active, the exclamation mark typically signals that your device is connected to the router but the router cannot reach the wider internet. This can happen when the first part of the connection (device to router) works, but the second part (router to ISP) fails temporarily or partially (Transit Wireless WiFi) or due to configuration issues (IPshu) .

Common Causes

- **ISP or Network Issues:** Temporary outages or maintenance from your internet service provider can trigger the warning even if the fiber line is active .
- **Router Configuration Errors:** Incorrect IP settings, DNS misconfigurations, or firmware bugs can prevent proper internet access .
- **IP Conflicts:** Two devices on the same network assigned the same IP address can confuse the router and cause the exclamation mark .
- **Hardware or Firmware Problems:** Router glitches or outdated firmware may disrupt communication with the ISP .
- **Interference or Signal Issues:** Wireless interference or physical obstructions can sometimes affect connectivity, though this usually impacts speed rather than causing the exclamation mark
