

Should we decide on the distribution box or the cable first

Article Overview

It is generally recommended to decide on the distribution box first, as its type, capacity, and location determine the cable specifications and routing.

Why Choose the Distribution Box First

The distribution box is the core of any electrical system, responsible for safely distributing power to multiple circuits and protecting against overloads, short circuits, and electrical hazards . Selecting the right box first ensures that:

- Load capacity matches your needs: The box must accommodate the total expected load and allow for future expansion .
- Proper placement is determined: The box should be installed in a dry, accessible location with adequate ventilation, typically around 1.5 meters above the floor for residential setups .
- Protection devices are correctly specified: Circuit breakers, fuses, and RCDs are chosen based on the box type and expected circuits .

How Cable Selection Follows

Once the distribution box is chosen:

- Cable type and gauge are determined by the box's load capacity and the distance to each circuit
