

The router's fiber optic interface is not working

Article Overview

A non-working fiber optic interface on a router is often caused by physical cable issues, dirty connectors, incompatible SFP modules, or configuration errors, and can usually be resolved through systematic inspection and testing.

Step 1: Inspect Physical Connections

Check all fiber cables for visible damage such as cuts, sharp bends, or kinks, and ensure connectors are fully seated in the router and any patch panels. Dirty or contaminated connectors are a common cause of signal loss, so clean them using lint-free wipes and isopropyl alcohol if necessary. Verify that the correct fiber type (single-mode or multi-mode) is used and that polarity is correct.

Step 2: Verify SFP Modules

Ensure that the SFP transceivers are compatible with your router. Using non-certified or third-party SFPs can lead to unpredictable behavior. Remove and reseat the SFP module to confirm proper insertion. If possible, swap the SFP with a known working unit to rule out module failure.

Step 3: Check Router and Interface Status

Examine the router's interface LEDs. A "LOS" (Loss of Signal) indicator suggests connectivity issues. Restart the router or optical network terminal (ONT) to resolve...
