

Transverse Mode Selection of Fiber Bragg Gratings

Overview

We propose a novel approach for achieving selective transverse mode operation of few-mode all-fiber lasers. , limiting the brightness that can be achieved from the multi-mode system. In order to improve the brightness from such multi-mode systems, we present a method of transverse mode selection utilizing volume Bragg gratings (VBGs) as an angular filter, allowing for high beam quality from large mode. An Optical Fiber Bragg Grating (FBG) is a periodic modulation of the refractive index within the core of an optical fiber. This is achieved by creating a periodic variation in the refractive index of the fiber core, which generates a. The problem of finding solutions to the wave-propagation equations is simplified by assuming weak guidance, which allows the decomposition of the modes into an orthogonal set of transversely polarized modes [1-3].

Fiber Bragg Gratings

Fiber Bragg gratings are reflective structures in the core of an optical fiber with a periodic or aperiodic perturbation of the effective refractive index.
