

What does it mean when a router's fiber optic cable emits blue light

Article Overview

A blue light on a router's fiber optic cable generally indicates normal operation, an active internet connection, or that a specific feature like WPS is active.

Interpretation of Blue Lights

Blue lights on routers or optical network terminals (ONTs) are often used as a status indicator rather than a warning. Depending on the device and manufacturer, a blue light can mean:

- Normal operation: The router or ONT is powered on and connected to the internet properly, signaling that the fiber optic link is active and functioning correctly .
- Active connection or data transmission: A blinking blue light may indicate that data is being transmitted over the fiber connection, showing network activity .
- WPS (Wi-Fi Protected Setup) mode: Some routers use a blue light to indicate that WPS is active, allowing devices to connect securely without entering a password .

Blinking vs. Solid Blue

- Solid blue: Typically indicates a stable, active connection with no issues.
- Slow blinking: Often shows that the router is attempting to establish a connection or initializing the fiber link.
- Rapid or irregular blinking: Usually signals active data transfer between the router and connected devices
