

What is the material of the glass in a network server rack

Article Overview

The glass used in network server racks is typically 4-5 mm thick tempered safety glass, heat-treated to meet EN 12150-1 standards.

Network server racks with glass doors use tempered glass to provide both visibility and safety. Tempered glass is 3 to 5 times more impact-resistant than regular annealed glass, making it suitable for environments where technicians work near racks with hand tools or heavy equipment. In the event of breakage, tempered glass shatters into small granular pieces rather than sharp shards, reducing the risk of injury. The typical thickness of the glass in these racks is 4-5 mm, which balances durability with visibility for monitoring equipment without opening the door. The glass is heat-treated according to EN 12150-1 standards, ensuring it meets safety and performance requirements for commercial and IT environments. Tempered glass doors also contribute to dust protection and security while allowing visual inspection of network equipment. For racks generating higher heat loads (above 3 kW per rack), alternative door materials like mesh may be preferred for better airflow, but tempered glass remains the standard for most office, IT closet, and distribution center applications.
