

What to do if the fiber optic cable to the switch is not connected

Article Overview

A switch may fail to connect to a fiber optic cable due to physical damage, incompatible SFP modules, dirty connectors, or configuration issues.

Check Physical Connections

Ensure the fiber optic cable is properly seated in the switch port and the remote device. Inspect the cable for visible damage, sharp bends, or loose connectors, as even minor physical stress can prevent a link from forming . Verify that the connectors match the switch port type (e.g., LC, SC) and that the cable length does not exceed the transceiver's specifications .

Verify SFP Module Compatibility

Only use Cisco-compatible SFP transceivers with Cisco switches, as third-party or unsupported modules can cause unpredictable behavior . Check the switch for the installed SFP model using the `show idprom interface` command and confirm compatibility with the Cisco Optics-to-Device Compatibility Matrix . If the SFP is suspected to be faulty, swap it with a known-good module .

Clean Fiber Connectors

Contamination on fiber connectors is a common cause of link failure. Use lint-free wipes and isopropyl alcohol to clean both ends of the fiber before reinserting them
