

X-ray fluorescence spectroscopy analyzer energy dispersive

Overview

With energy dispersive X-ray fluorescence (EDXRF) analysis, the X-ray fluorescence energy spectrum of whole groups of elements is processed simultaneously using an energy dispersive detector. EDXRF can be used for both qualitative and quantitative elemental analysis. It is widely used for non-destructive elemental analysis for quality and process control in. An X-ray beam ionizes the atoms in the sample, the detector detects the resulting fluorescence radiation, and our in-house developed software processes the signals. These versatile devices play a pivotal role in scientific research, quality control, and industry applications Malvern Panalytical XRF analyzers excel at. Improved accuracy based on optimized spectra handling: Master the unknown using the benchmark in ED-XRF screening, SPECTRO's TurboQuant II application package for the unprecedented ability to analyze unknown samples, whether they are liquids, solids or powders - whether they are tree leaves.
